

# Neutrino Oscillation Measurements with DUSEL Based Detectors Using Accelerator Beams

Mark Dierckxsens  
University of Chicago

Underground Detectors Investigating Grand  
Unification Workshop  
October 16-17, 2008 @ BNL

- Current status & near term future of neutrino oscillation measurements
- Long baseline + wideband beam concept
- Neutrino beams
- Water Cherenkov detector
- Liquid Argon detector
- Sensitivity calculations
- Sensitivities under various assumptions
- Conclusions

# Neutrino Oscillations

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = \begin{pmatrix} U_{e1} & U_{e2} & U_{e3} \\ U_{\mu1} & U_{\mu2} & U_{\mu3} \\ U_{\tau1} & U_{\tau2} & U_{\tau3} \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix} \Rightarrow$$

PMNS matrix:  
3 mixing angles  
1 CP phase  
(2 CP Majorana phases)

solar

$$U = \begin{pmatrix} \cos \theta_{12} & \sin \theta_{12} & 0 \\ -\sin \theta_{12} & \cos \theta_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

$\theta_{12} \approx 34^\circ$

atmospheric

$$\begin{pmatrix} \cos \theta_{13} & 0 & \sin \theta_{13} e^{i\delta} \\ \sin \theta_{13} e^{-i\delta} & \cos \theta_{13} & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos \theta_{23} & \sin \theta_{23} \\ 0 & -\sin \theta_{23} & \cos \theta_{23} \end{pmatrix}$$

???

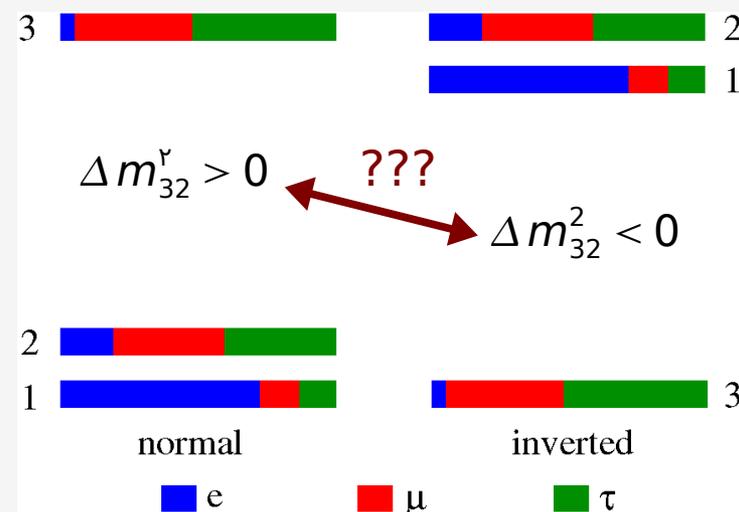

$\theta_{23} \approx 45^\circ$

neutrino masses must differ to observe  $\nu$  oscillations:

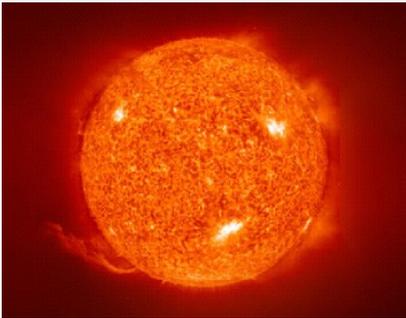

$$\Delta m_{21}^2 = m_2^2 - m_1^2 \approx +7.9 \cdot 10^{-5} \text{ eV}^2$$

$$|\Delta m_{31}^2| = |m_3^2 - m_1^2| \approx 2.4 \cdot 10^{-3} \text{ eV}^2$$

$$\Delta m_{31}^2 = \Delta m_{21}^2 + \Delta m_{32}^2$$

# Current Status

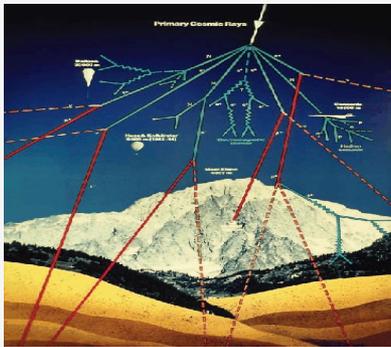

SNO, KamLAND, Super-K, ...

$$\Delta m_{21}^2 = 7.67_{-0.19}^{+0.16} \cdot 10^{-5} eV^2$$

$$\sin^2 \theta_{12} = 0.312_{-0.018}^{+0.019}$$

$$\theta_{12} \approx 34^\circ$$

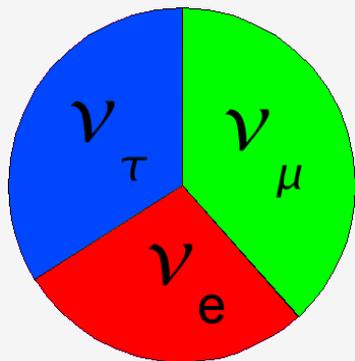

Super-K, MINOS, K2K, ...

$$|\Delta m_{31}^2| = 2.39_{-0.08}^{+0.11} \cdot 10^{-3} eV^2$$

sign?

$$\sin^2 2\theta_{23} > 0.95 \quad (90\% \text{ CL})$$

$$\theta_{23} \approx 45^\circ$$

Chooz, Solar, LB, Atm, ...

$$\sin^2 2\theta_{13} < 0.13 \quad (90\% \text{ CL})$$

$$< 0.18 @ 3\sigma$$

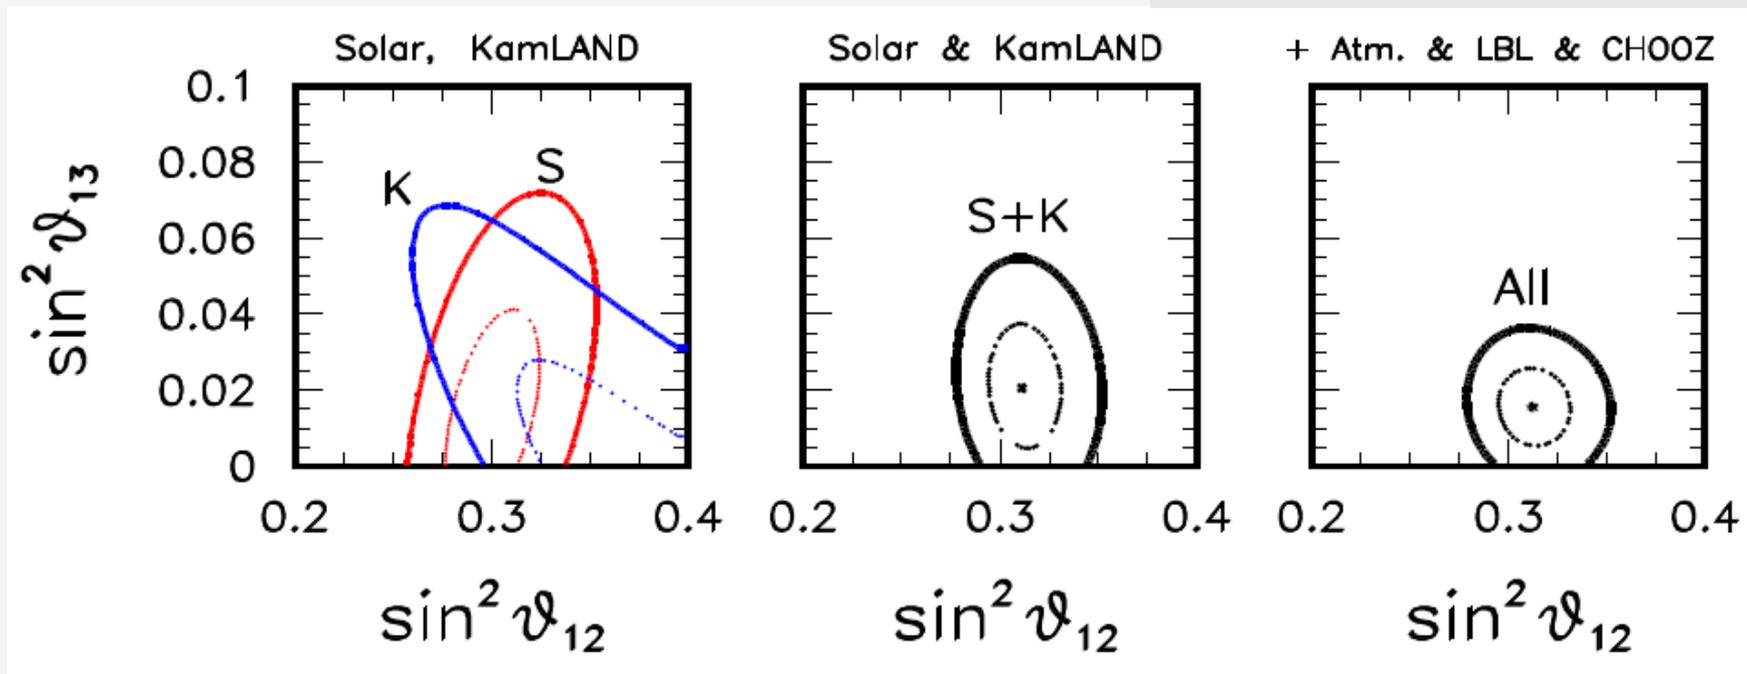

$$\delta_{CP} = ???$$

Fogli et al, arXiv:0805.2517

- Interesting results emerging from combination of global oscillation data:  $\sin^2 2\theta_{13} = 0.063 \pm 0.039$

Fogli et al, arXiv:0809.2936

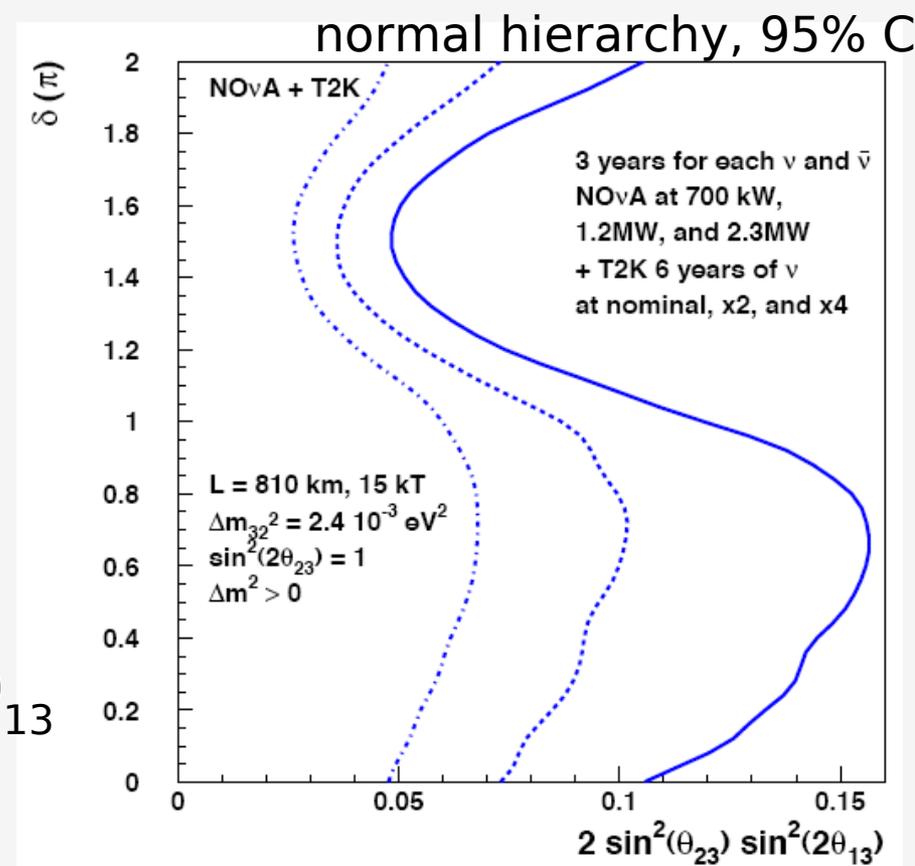

- Is  $\theta_{13}$  really non-zero or “accidental”?  
→ Will need experiments!

# Near Future Experiments

- MINOS: just below current limits
- Next phase experiments will probe  $\sin^2 2\theta_{13}$  around 0.01:

- Reactor neutrinos:  
Double Chooz, RENO,  
Daya Bay
- Off-axis beams: Nova, T2K
- Need next generation experiments to:
  - Extend search for/measure  $\theta_{13}$
  - Determine mass hierarchy
  - Explore CP violation

# Wideband Beams – Long Baselines

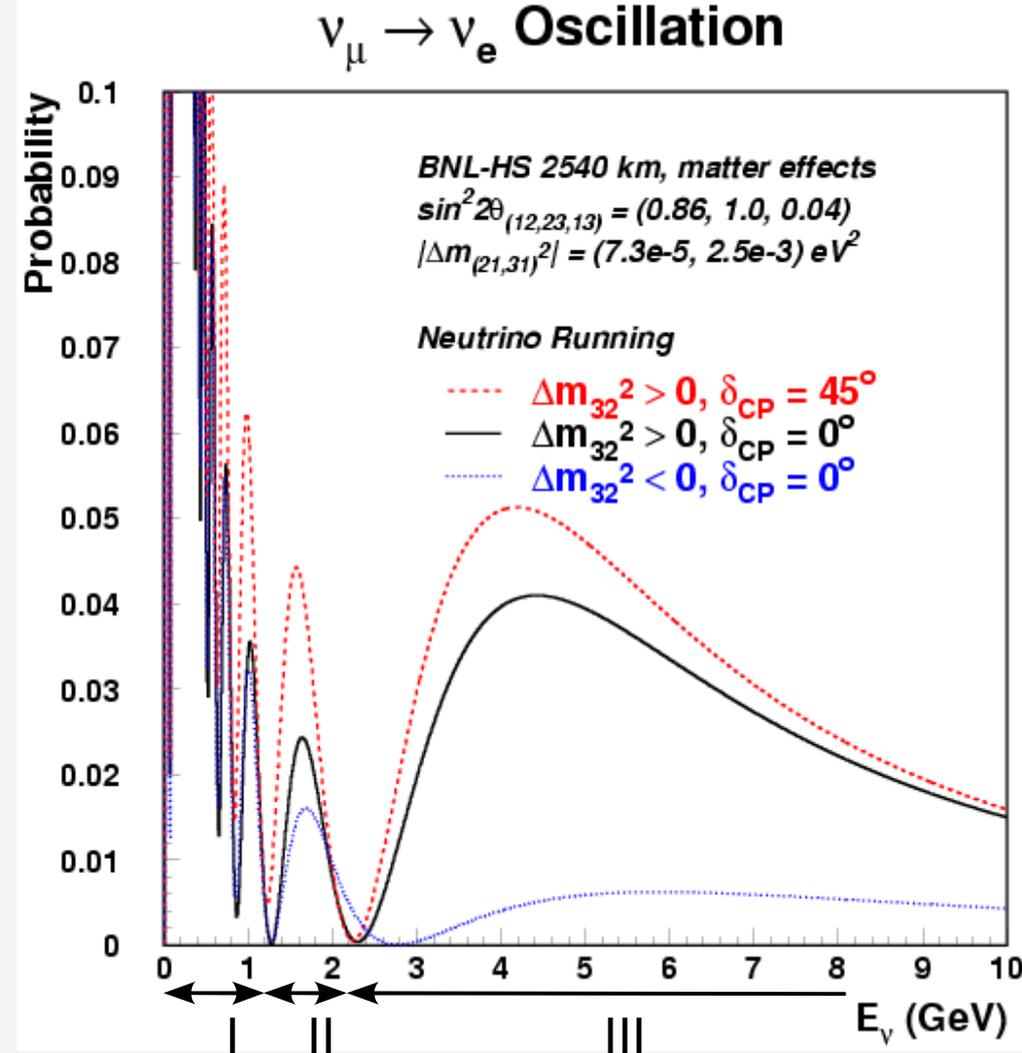

- Energy dependence:

	I	II	III
$\sin^2 2\theta_{13}$	+	+	+
$\text{sign}(\Delta m_{32}^2)$	0	0	++
$\delta_{CP}$	+	++	+
<b>solar</b>	++	+	0

- Longer baselines:

- Larger matter effects

- Oscillation nodes at higher energies: large xsections, away from NC background, above Fermi motion regime (>500MeV)

## US Long Baseline Neutrino Experiment Study

### ✓ Charge:

- A broad-band proposal using either an upgraded beam of  $\sim 1$  MW from the current Fermilab accelerator complex or future Proton Driver beam aimed at a DUSEL-based detector. Compare results with proposal for high intensity beam from BNL to DUSEL.
- Off-Axis next generation options using a 1-2 MW beam from Fermilab and a liquid Argon detector at either DUSEL or as second detector for NOVA.

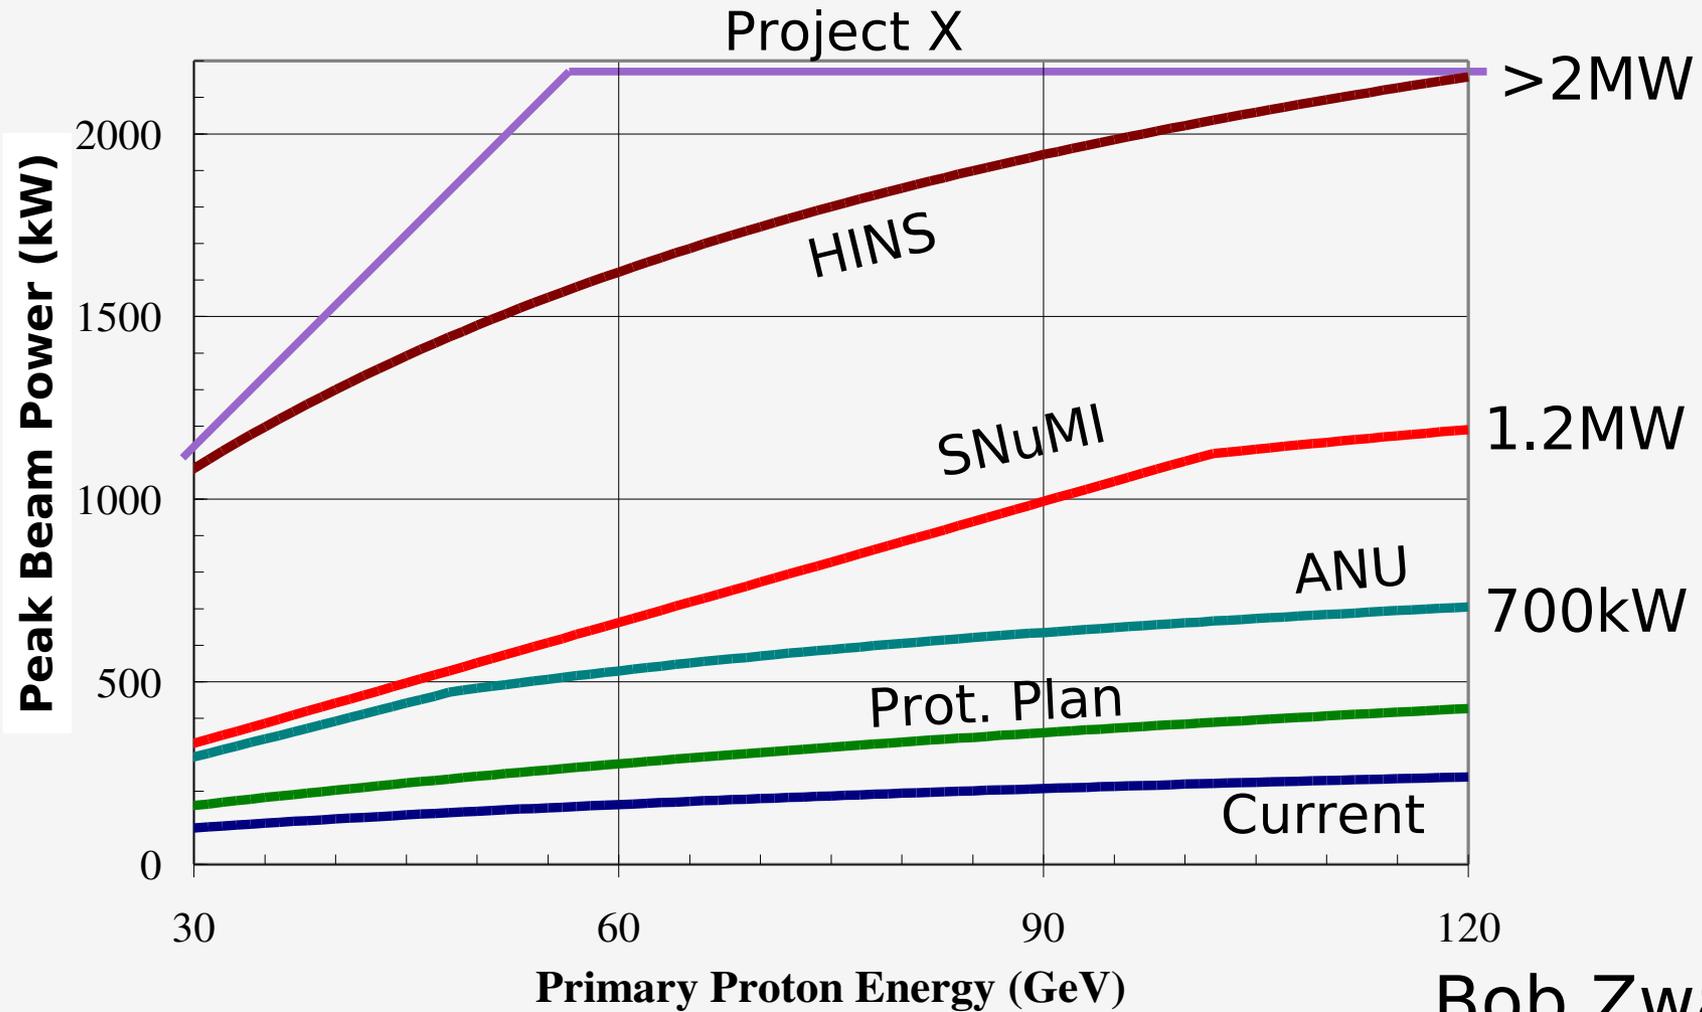

Report: [arXiv:0705.4396](https://arxiv.org/abs/0705.4396)

<http://nwg.phy.bnl.gov/fnal-bnl>

# Proton Intensity

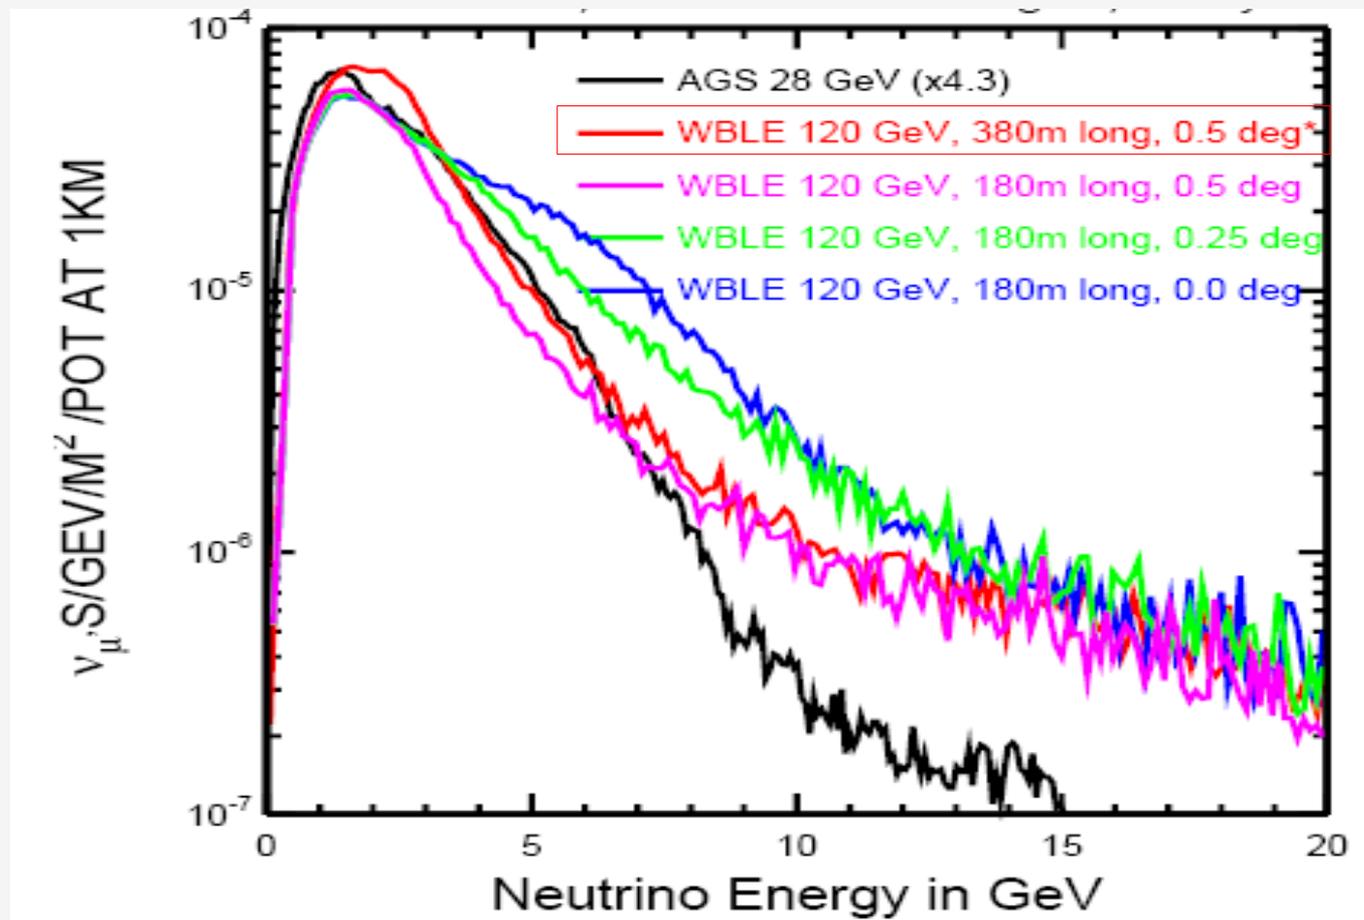

- Possible increases to proton intensity @ FNAL:

# Neutrino Beam

- Simulation using NuMI Monte Carlo, with modifications

- See talk M. Bishai

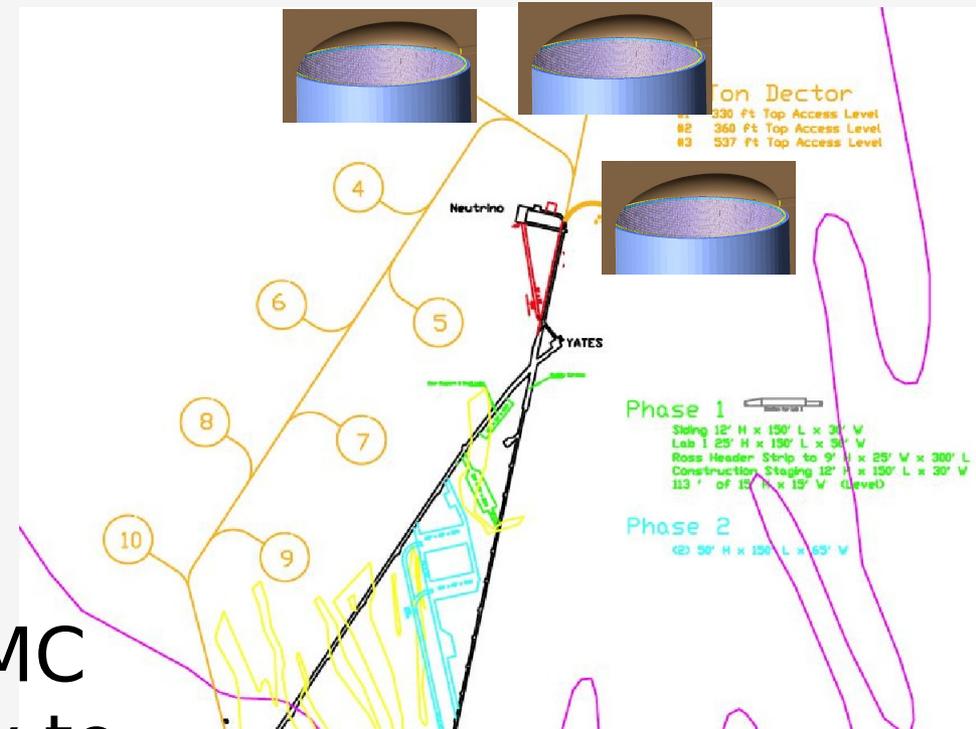

- Water Cherenkov:
  - Known technology
  - Scaling few times Super-K
  - Low efficiency & purity
- Liquid Argon:
  - High efficiency & purity
  - Not proven at the required size

# Water Cherenkov Detector

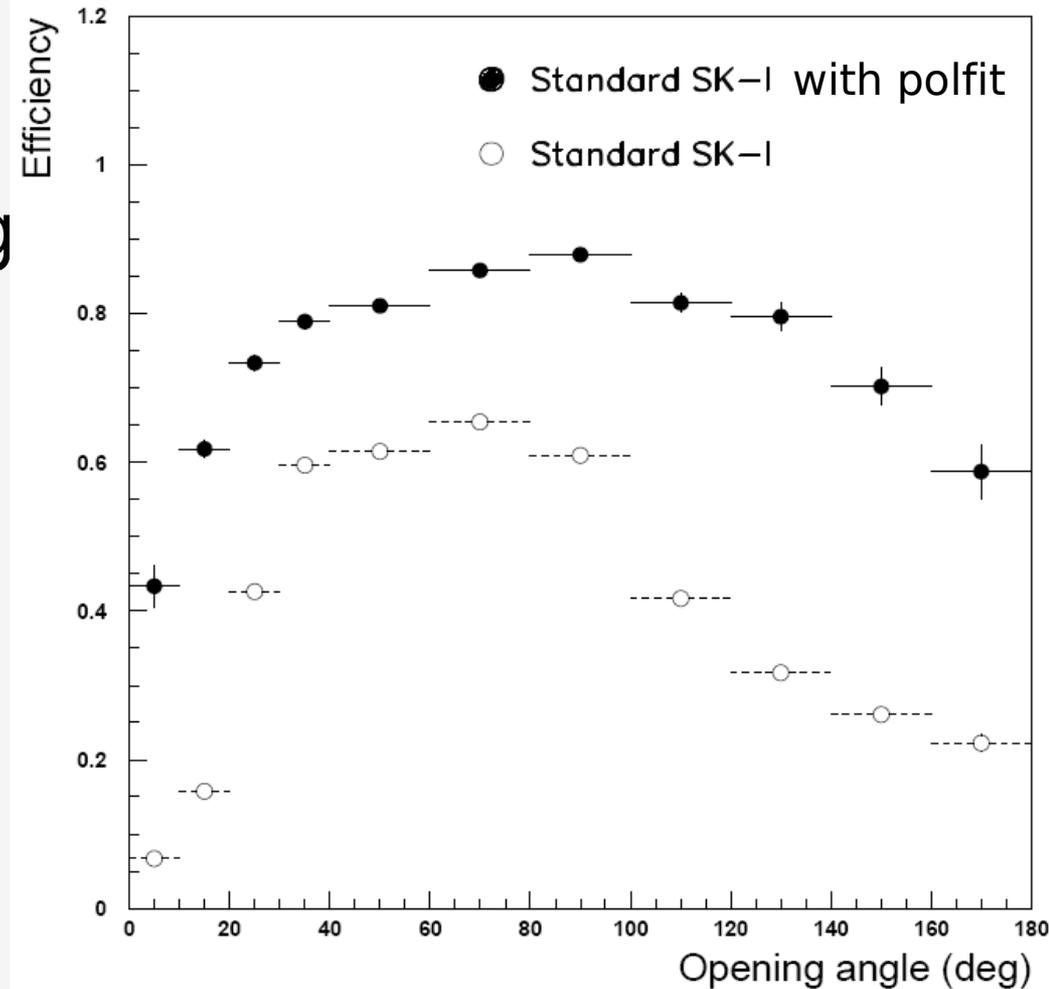

- 300kt fiducial mass
- Two independent studies to reduce NC background contamination in  $\nu_e$  selection beyond SuperK:
  - C. Yanagisawa
  - F. Dufour & E. Kearns
- Use SuperK atmospheric MC and follow similar strategy to improve separation between electrons and  $\pi^0$  decays
- Results from both studies are in agreement

# Water Cherenkov Detector

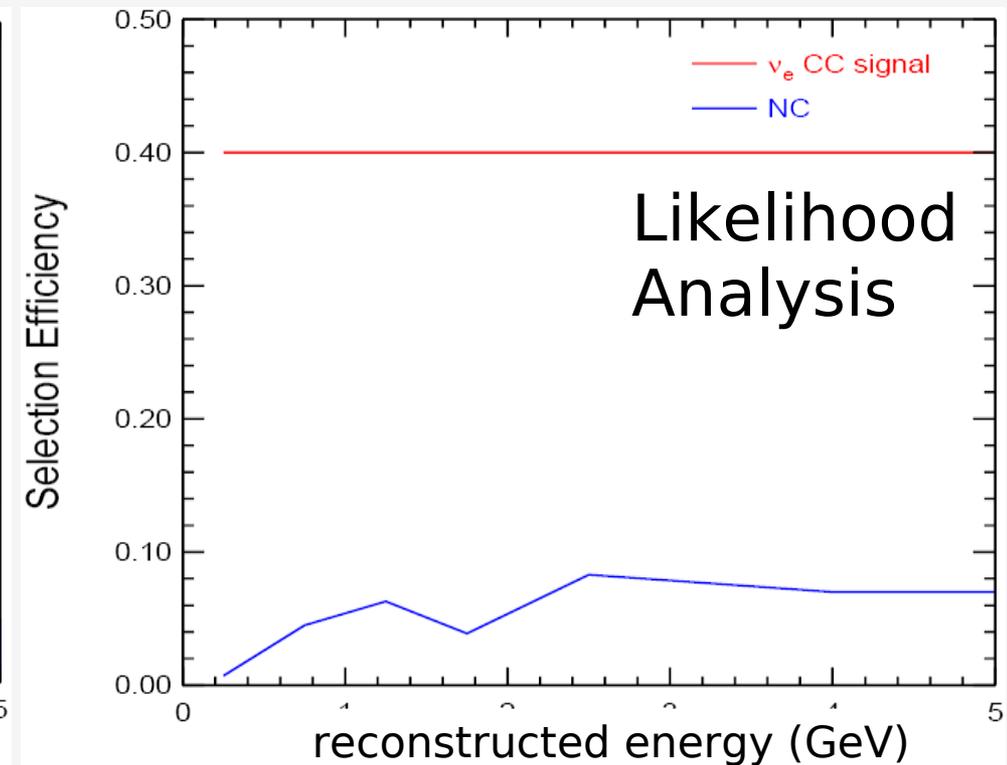

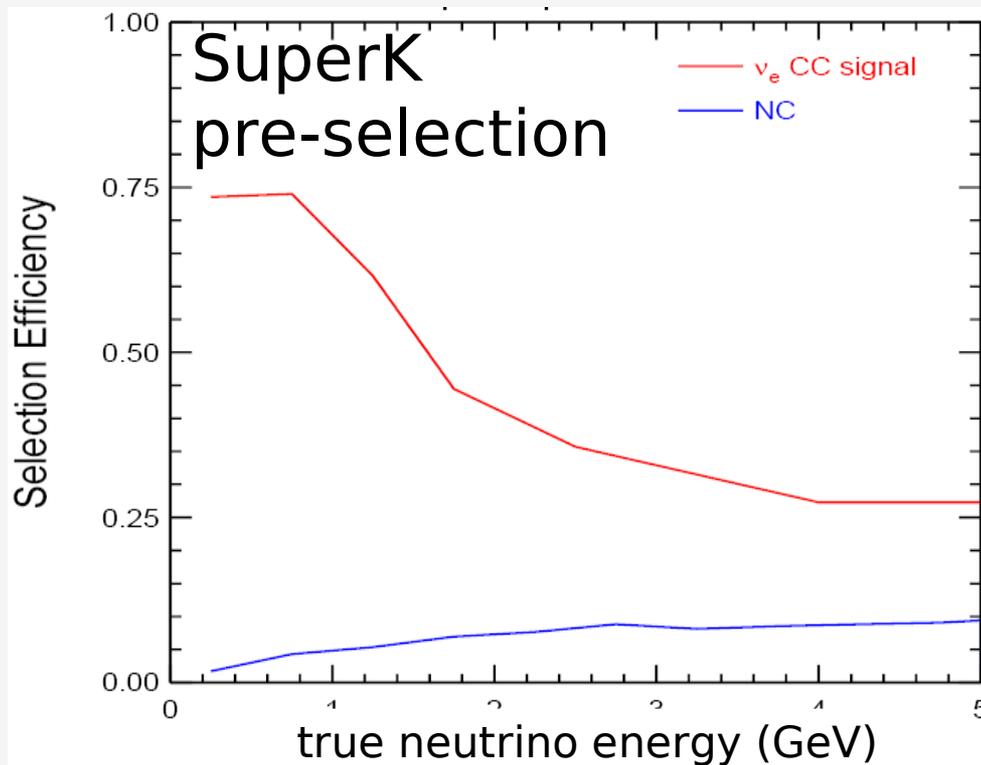

- Standard SuperK cuts used to select single ring e-like events
- An improved  $\pi^0$  reco algorithm to find 2<sup>nd</sup> ring  
increase efficiency by 20-30%
- 40% coverage with 20" PMTs: efficiency at low opening angles can be increased with finer granularity. Need dedicated MC studies

# Water Cherenkov Detector

- Output of  $\pi^0$  finder + several other variables (some related to the knowledge of neutrino direction) used as input for likelihood based selection

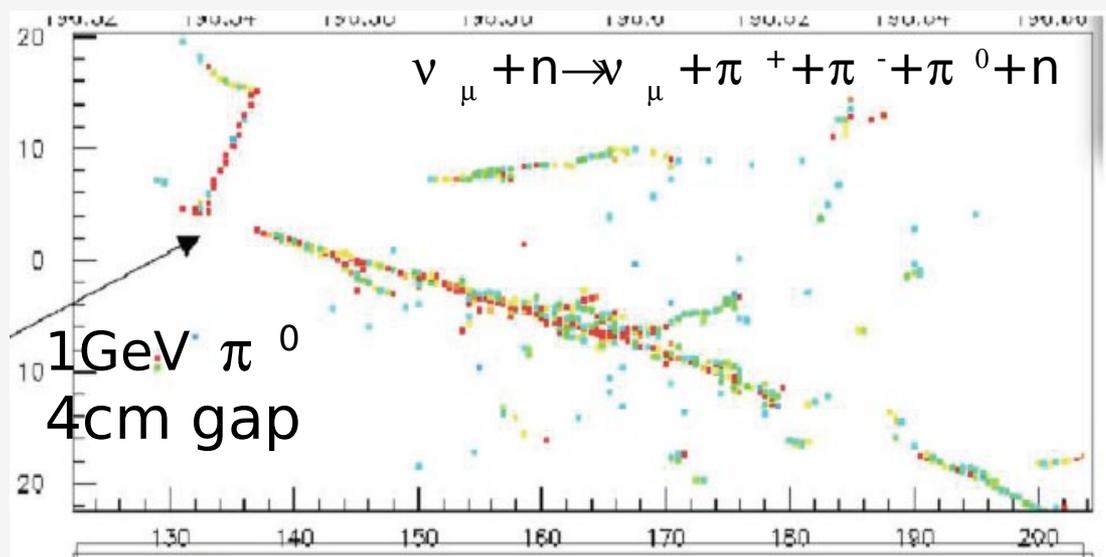

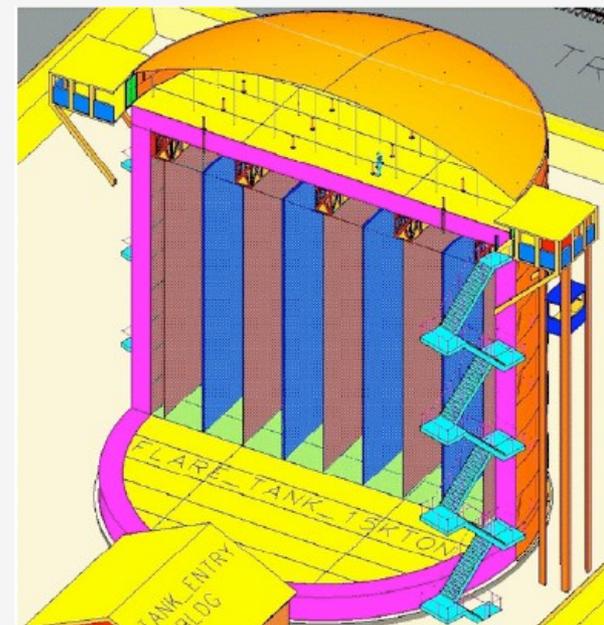

- Both efficiencies applied sequentially: overall  $\nu_e$  efficiency 14%, NC rejection > 98%

# Liquid Argon

- 50-100kt liquid Argon (Lar) TPC detector
- Signal & background efficiencies based on hand scanning:  
(Tufts U. group)
  - $\nu_e$  CC selection efficiency: 80%
  - NC background rejection >99%

- Efficiency exceeded for QE using initial automated tools (A. Curioni)
- See talk K. McDonald

- **Sensitivity to non-zero  $\theta_{13}$ :**  
Fit spectrum generated for particular  $(\theta_{13}, \delta_{cp})$  to hypothesis with  $\theta_{13} = 0$ .
- **Sensitivity to mass hierarchy:**  
Fit spectrum for particular  $(\theta_{13}, \delta_{cp})$  to hypothesis with opposite mass hierarchy.  
Both  $\theta_{13}$  and  $\delta_{cp}$  are allowed to float.
- **Sensitivity to CP violation:**  
Fit spectrum generated for particular  $(\theta_{13}, \delta_{cp})$  to hypotheses  $\delta_{cp} = 0$  and  $\pi$ . Take worst  $\chi^2$ .  
 $\theta_{13}$  is allowed to float in fit.
- **$(\theta_{13}, \delta_{cp})$  measurement:**  
Parameter measurement for a set of true values

- Two independent calculations with compatible results:
  - Fast MC implemented by N. Saoulidou (FNAL)
  - GloBES: M. Bishai, M. Diwan, M. Dierckxsens (BNL)
- Results shown here are from the latter
- Default assumption in background error is 5%
- Errors on oscillation parameters & matter density (5%) included
- Main change wrt FNAL-BNL study:  
reduced  $\Delta m_{31}^2$  from  $2.7 \cdot 10^{-3} \text{ eV}^2$  to  $2.4 \cdot 10^{-3} \text{ eV}^2$

# Sensitivity Calculations

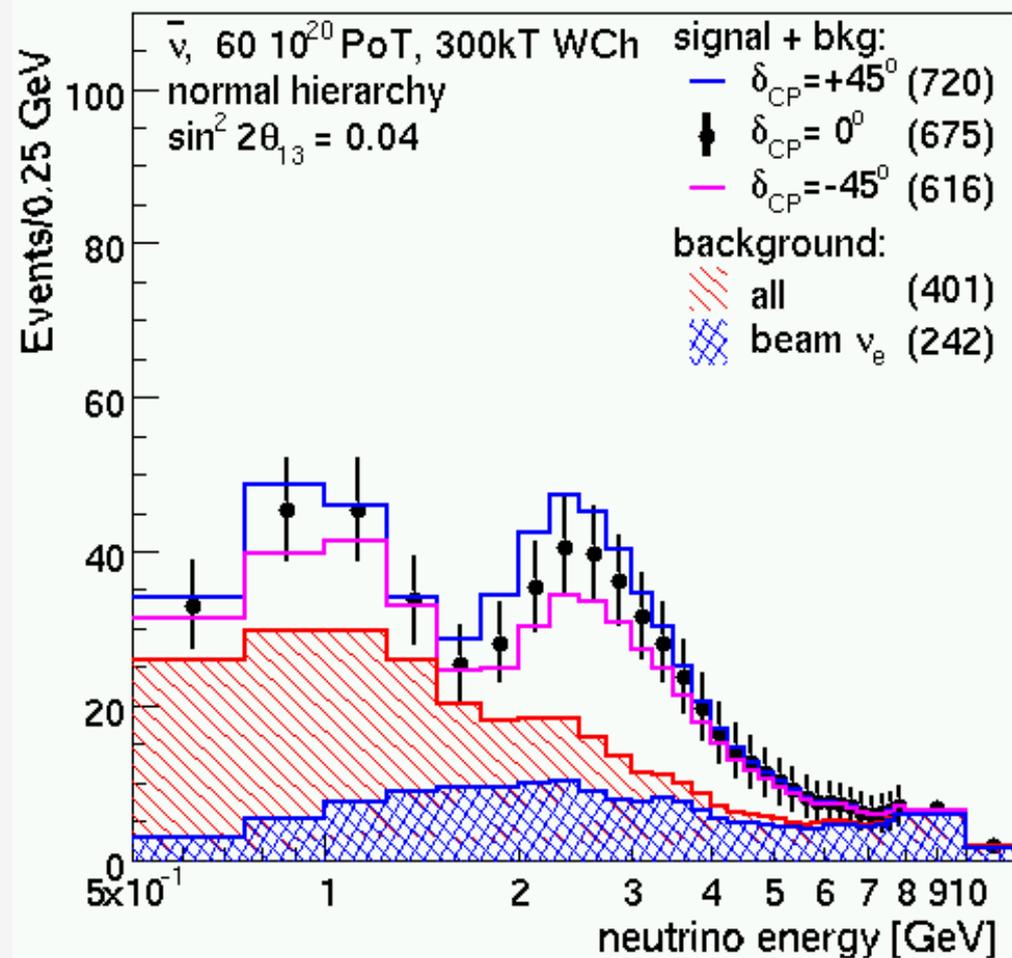

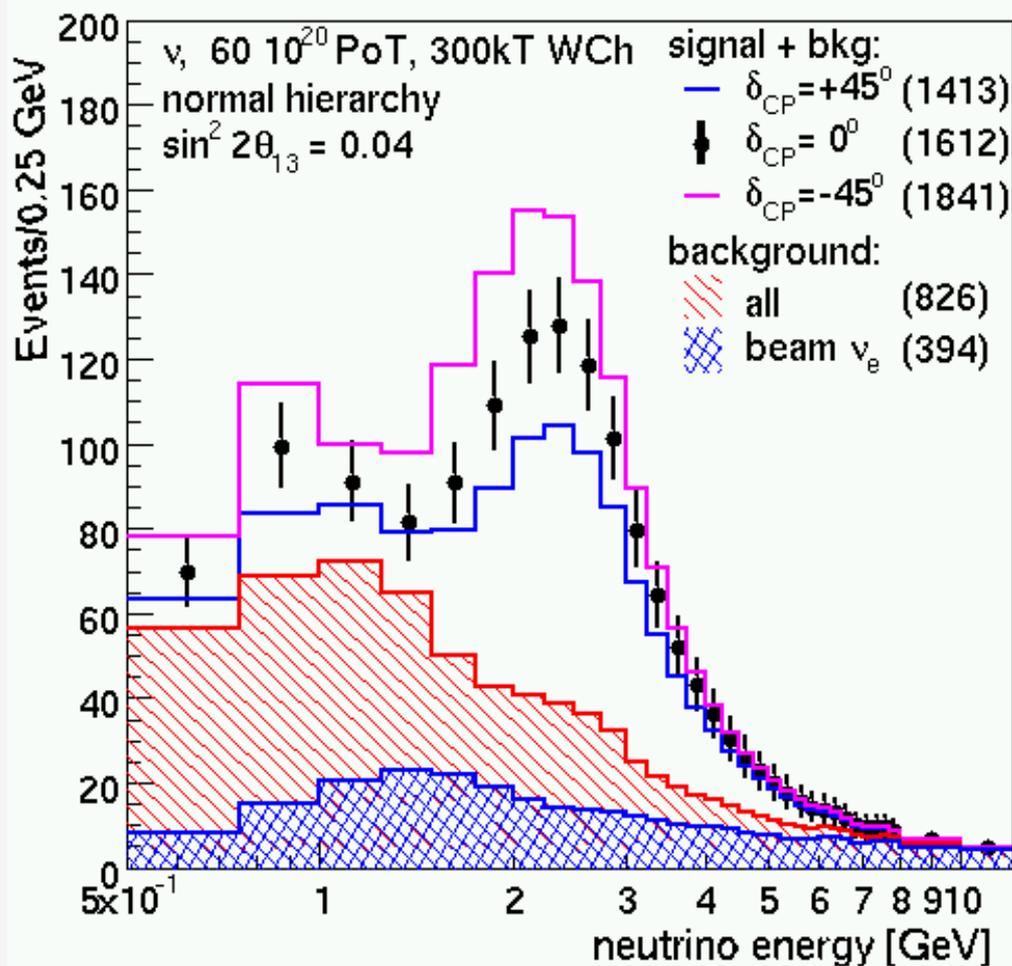

- Assumptions for GloBES implementation.
- Water Cherenkov:
  - Use efficiencies derived by C. Yanagisawa
  - Parametrized smearing functions:
    - $\nu_e$  CC:  $\sigma(E) \sim 10\%$  at 1 GeV
    - $\nu_x$  NC: based on NUANCE
- Liquid Argon:
  - 80% efficiency  $\nu_e$  CC
  - Complete rejection NC
  - $\sigma(E) = 5\%$  for QE, 20% for non-QE

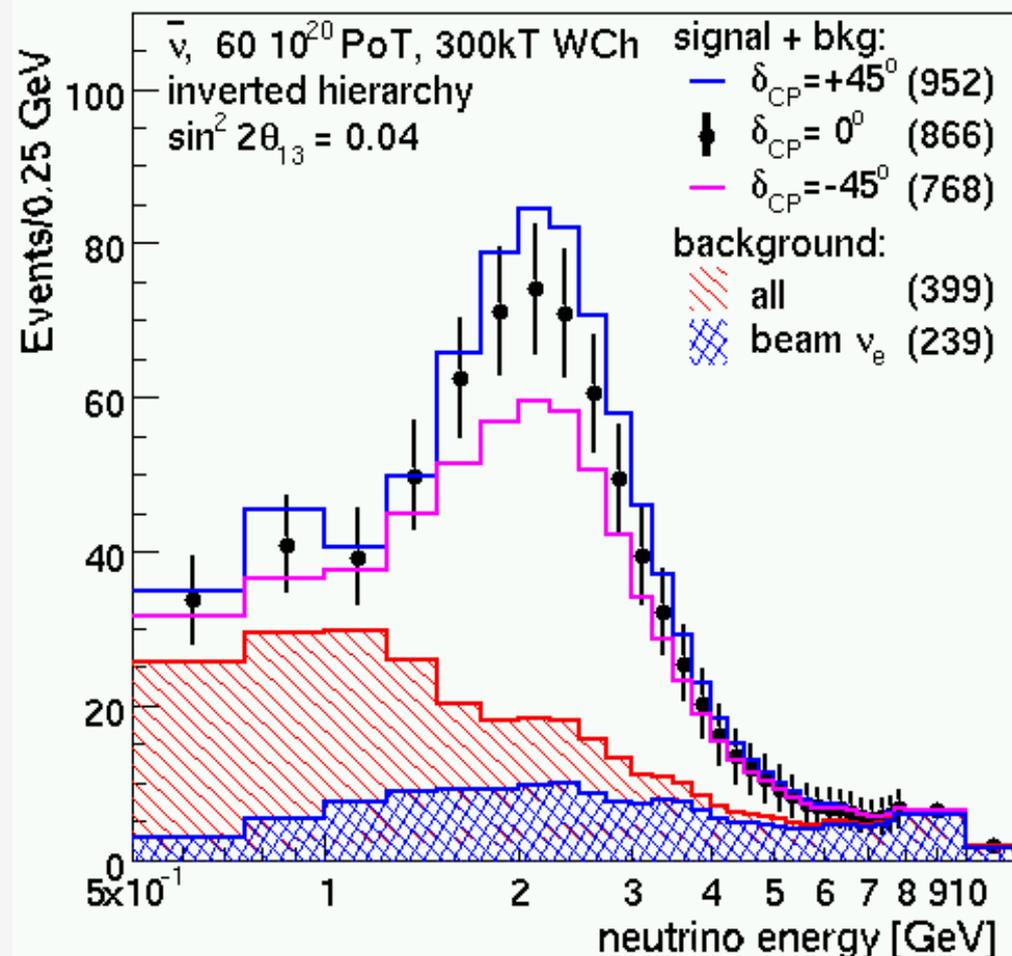

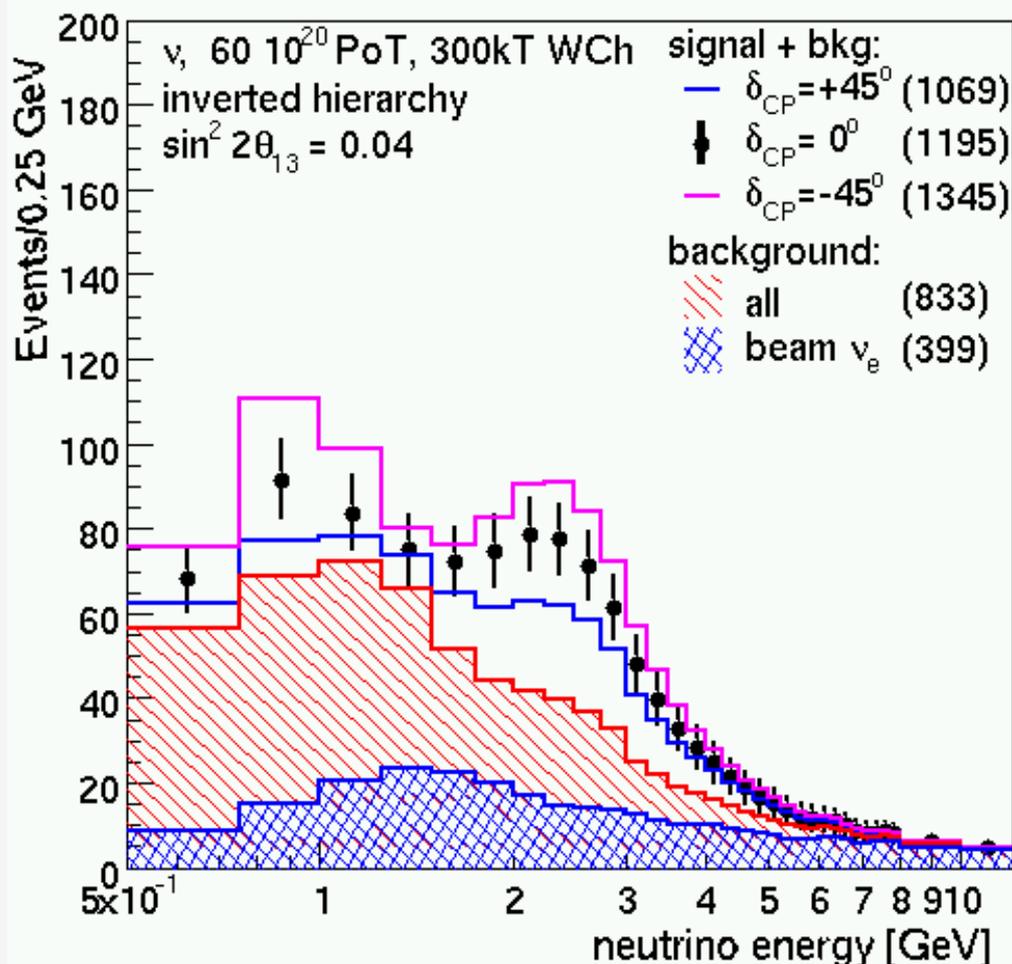

- Large detectors and powerful beams are needed to collect required statistics
- Use 120 GeV proton beam at  $0.5^\circ$  off-axis to reduce high energy tail
  - Other beam option where investigated during study, e.g. 60 GeV on axis at same power gives similar sensitivities
- Use beam powers of 1.2MW & 2.4MW
- Running time assumed is 3 yrs  $\nu$  + 3 yrs anti- $\nu$
- Detector mass:
  - WCh: 300 kt
  - LAr:  $\epsilon_{\text{LAr}}/\epsilon_{\text{WCh}} \sim 6 \rightarrow 50\text{kt}$

# Spectra – Water Cherenkov

	50kt, 2.4MW	0.005	0.011	0.010
	100kt, 2.4MW	0.003	0.008	0.003

Need  $\sim 6x$  smaller LAr to obtain similar sensitivities to WCh  
Small NC bkg contamination will affect LAr, in particular CPV

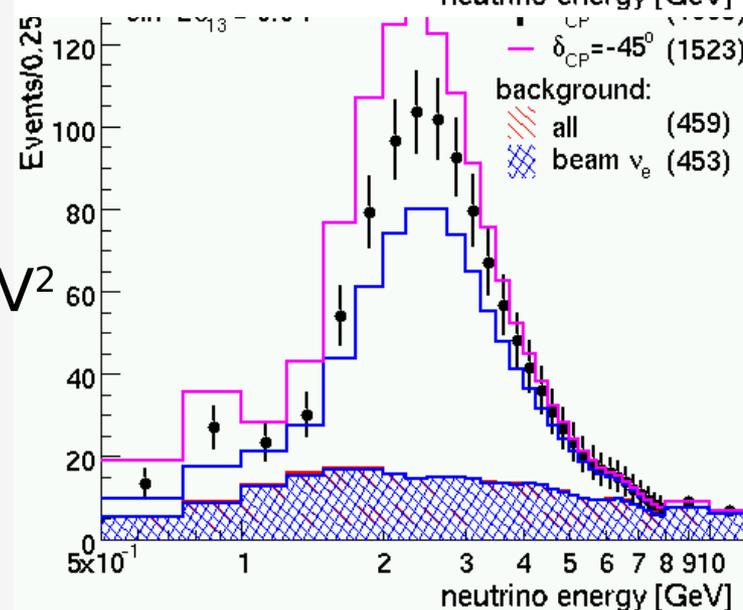

# Effect of lower $\Delta m^2_{31}$ on spectra

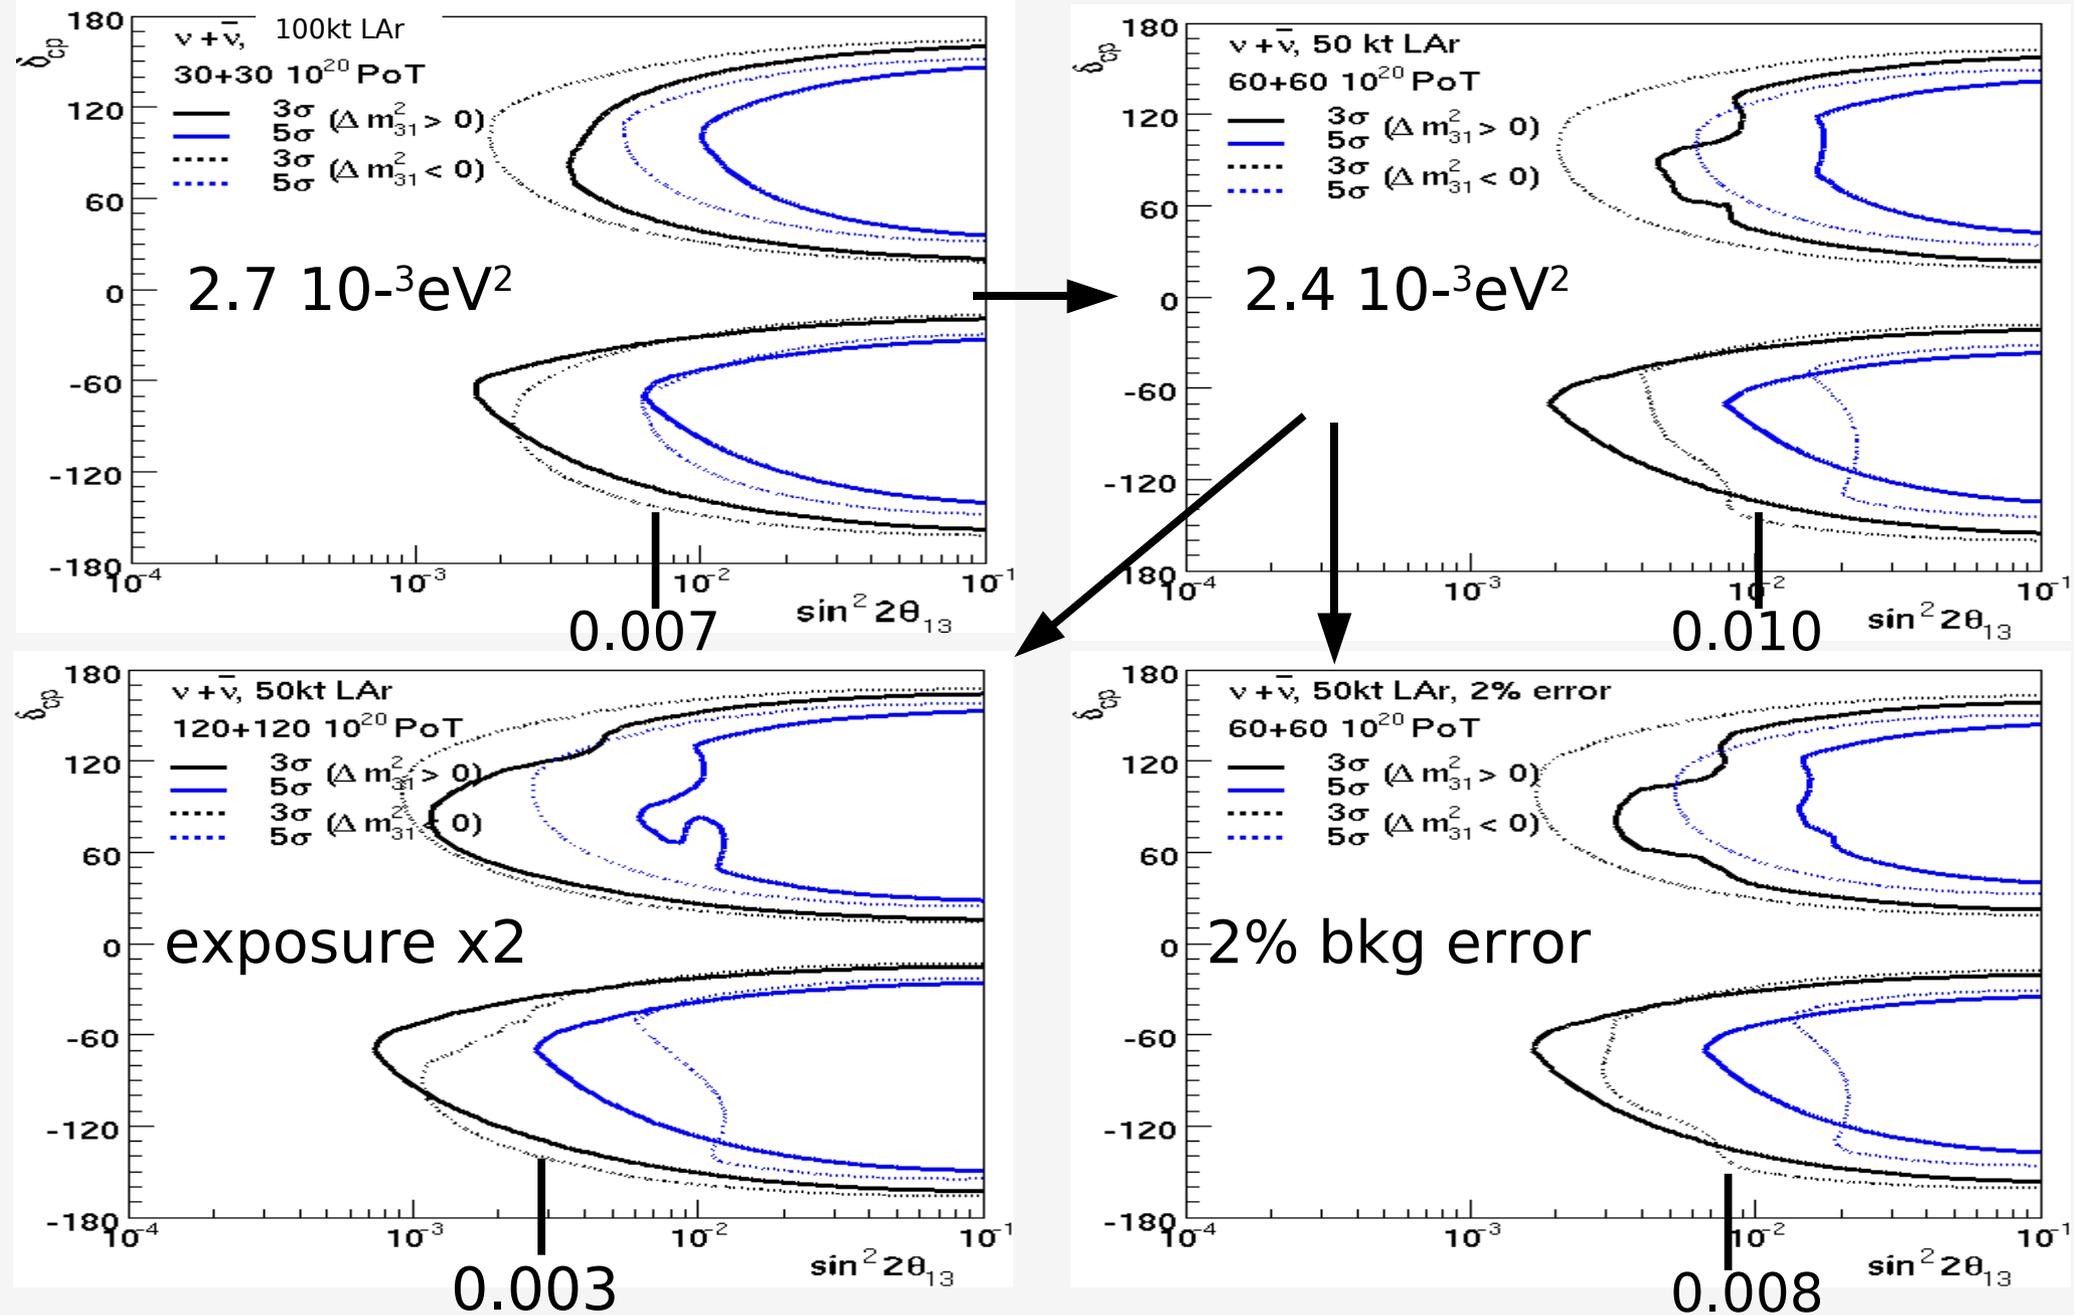

$2.7 \cdot 10^{-3} \text{ eV}^2$

$2.4 \cdot 10^{-3} \text{ eV}^2$

# Effect of lower $\Delta m^2_{31}$ on CPV

# Background uncertainties

	background error	$\sin^2 2\theta_{13} \neq 0$ $3\sigma$ , all $\delta_{cp}$	$\text{sign}(\Delta m^2_{31})$ $3\sigma$ , all $\delta_{cp}$	CPV $3\sigma$ , 50% $\delta_{cp}$
Water Cherenkov 300kt	2%	0.005	0.012	0.013
	5%	0.006	0.012	0.015
	10%	0.006	0.013	0.016
Liquid Argon 50kt	2%	0.004	0.011	0.008
	5%	0.005	0.011	0.010
	10%	0.005	0.011	0.011

2.4MW beam, 6 years total

- With a 2.4MW beam, running 6 years total ( $\nu$ +anti- $\nu$ ) using either 300kt water Cherenkov or 50kt liquid Argon, the following measurements can be performed at  $3\sigma$  level:

	$\sin^2 2\theta_{13} >$	
$\sin^2 2\theta_{13} \neq 0$	0.005 - 0.006	(all $\delta_{cp}$ )
$\text{sign}(\Delta m^2_{31})$	0.011 - 0.012	(all $\delta_{cp}$ )
CP violation	0.010 - 0.015	(50% $\delta_{cp}$ )

- The 2<sup>nd</sup> oscillation node important for determining CPV. Focus at lower energies on:
  - Increasing neutrino flux
  - Understanding background rejection and uncertainties
  - (or go to longer baselines...)
- Need more detailed simulations for both detectors to:
  - Confirm and possibly improve assumed detector performance
  - Optimize detectors designs

# Extras

# Phased Approach

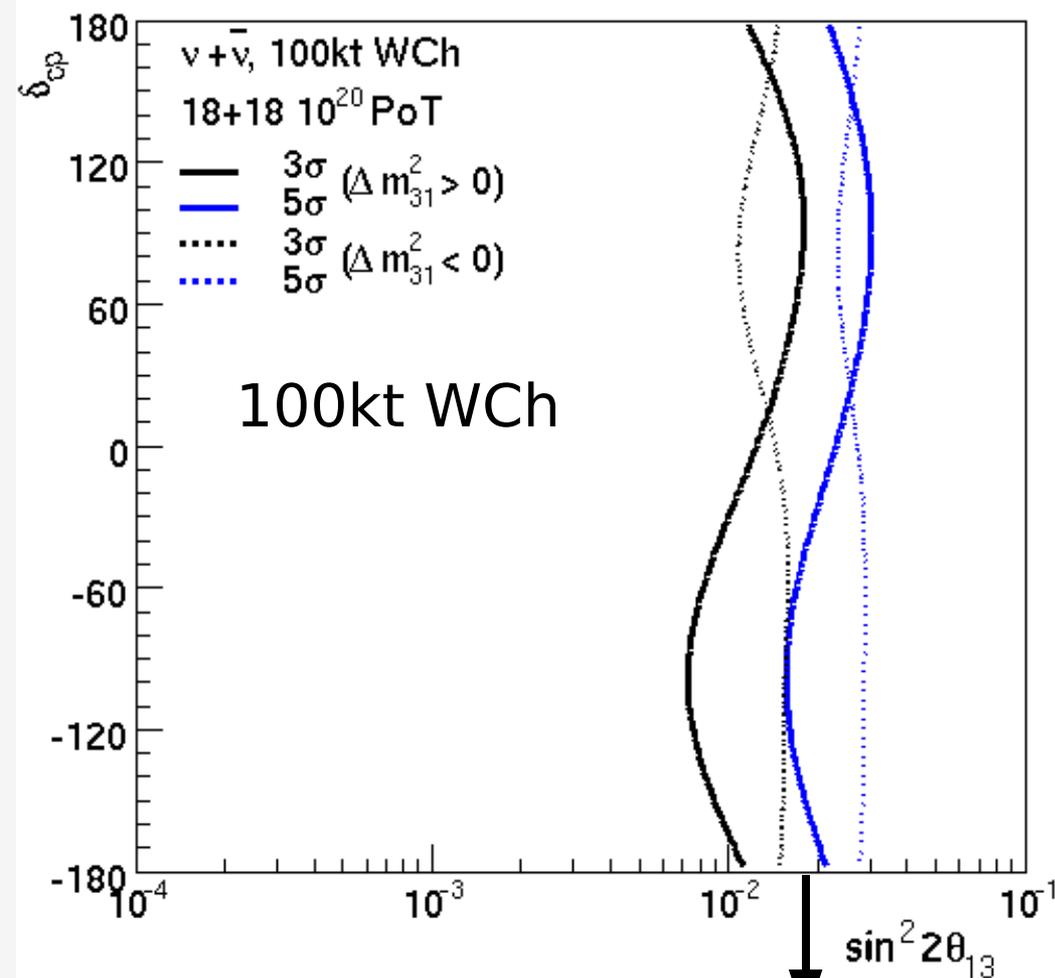

- Potential running plan: start with smaller detector ( $\sim 1/3$  of full mass) and 700kW (or 1.2 MW) beam
- All other assumptions are the same
- Following pages show sensitivities for such a plan

$$\sin^2 2\theta_{13} \neq 0$$
